

Eventify - Gaming Event Management Website

Overview

Eventify is a platform designed for gamers to discover upcoming gaming events, book tickets, and view live leaderboards. With a modern dark theme, it offers a seamless user experience for managing and participating in competitive tournaments.

Features

- 1. Event Discovery:**
 - Users can browse and view details of upcoming gaming events, including the event name, date, and description.
- 2. Ticket Booking:**
 - Users can easily book tickets for their selected events by filling out a simple form with their name, email, and event choice.
 - Once booked, users receive an on-screen confirmation.
- 3. Leaderboard:**
 - Displays a simple leaderboard showing player rankings and scores for ongoing or past tournaments.
- 4. Modern User Interface:**
 - The website uses a dark theme, providing a clean and modern design.
 - Interactive hover effects and alerts enhance user engagement.

Technology Stack

- **HTML5:** Used for the website's structure.
- **CSS3:** Used for styling, including the dark theme and layout adjustments.
- **JavaScript:** Adds interactivity to the website, such as booking ticket confirmation and leaderboard management.

Website Structure

```
|
├── index.html #Main HTML file containing the website structure
├── styles.css #CSS file for styling the website
└── script.js #JavaScript file for handling ticket booking and interactions
```

Usage Instructions

- 1. Opening the Website:**
 - After downloading the website files, open the `index.html` file in any modern web browser (e.g., Chrome, Firefox).

2. **Booking a Ticket:**

- Navigate to the "Tickets" section, fill in your name, email, and choose an event.
- Click the "Book Now" button to confirm your booking.
- An alert will confirm your booking details.

3. **Viewing the Leaderboard:**

- In the "Leaderboard" section, you can see the rankings and scores for players in various events.

Customization Instructions

1. **Adding New Events:**

- To add new events, modify the HTML code inside the `<section id="events">` in `index.html`. Each event includes a name, date, and a button for ticket booking.

2. **Modifying the Design:**

- The `styles.css` file contains the website's styling. To change colors, fonts, or layouts, simply adjust the values in the CSS file, such as color codes and padding/margins.

3. **Leaderboard Updates:**

- Currently, the leaderboard is static. For dynamic updates, consider integrating a back-end server that fetches live data from a database.

Future Enhancements

1. **Back-End Integration:**

- For dynamic ticket bookings and leaderboard updates, integrating a back-end database (like MySQL, MongoDB) and server-side scripting (like Node.js, PHP) is recommended.

2. **User Authentication:**

- Users can create accounts, track their bookings, and participate in tournaments with user profiles and history.

3. **Payment Integration:**

- Implement a payment gateway (e.g., PayPal, Stripe) to allow users to purchase tickets securely.
